# I. Introduction

This Calcpad program calculates plane frames with arbitrary sections using the finite element method. The input data is entered in text format as vectors and matrices as follows:

- joint coordinates;
- joint numbers at the ends of the elements;
- material properties;
- dimensions and types of cross-sections;
- support conditions;
- load values.

As a result, diagrams of internal forces and deflections of structural elements are obtained. The schemes are automatically generated by the program, using the SVG graphical format.
